A Safety Management System provides organizations with a framework to improve employee safety and health, reduce workplace risks and create better, safer working conditions. The development and implementation of a comprehensive Safety Management System will support continual improvement and enables an organization to develop and maintain a strong safety culture.

The formal and organization-wide approach to managing safety risk and guaranteeing the efficacy of safety risk controls is known as a safety management system (SMS). It consists of processes, practices, and policies for managing safety risks. In system safety and safety management, SMS presents an evolving process. It is a systematic procedure requiring businesses to treat safety with the same importance as other fundamental business activities.

Safety means not getting exposed to harm, safety is controlling of high risk in activities, so also safety is loss control. In totality, safety is a systematic approach in the control of activities, so as to avoid unwanted incidents and achieving good work environment. When systematic approach is practiced, it needs to be checked periodically for its effective functioning.

SEIL Energy India Limited (Formerly Sembcorp Energy India Limited) is a leading independent power producer (IPP) committed to India's energy security. The company has a successful track record of developing and operating thermal power generation assets in the country. It has a 2.64 GW supercritical thermal power generation complex located in SPSR Nellore district, Andhra Pradesh, India.

SEIL owns and operates 4 X 660 MW supercritical thermal power generation assets to provide reliable and essential electricity to consumers across the subcontinent. SEIL partners with the government and industry to support India's energy security and its urbanization and development goals. To ensure high performance and reliability, SEIL maintains high standards

of behaviour, integrity, and governance in its operations. With its efficient and reliable power generation, SEIL is well-positioned to offer a viable and best-in-class energy supply to meet the country's need for reliable and sustainable power.

Good safety practices of the organization are a very visible way of showing that the organization does value the people working with them; so also, it will be rewarded by a workplace that's not only safer but more productive as well.

Apart from implementing good safety practices, periodical checking of the performance of the practices or the systems is also required. Conducting safety audit is one such requirement.

Safety audits are intended to promote, improve and then maintain good safety performance.

Audits review safety programs, policies, and procedures to check that they cover employee job tasks and hazards. They are a structured and effective way of preventing incidents and controlling safety hazards.

Though several audits are being conducted by the organization, including internal audits of the systems being implemented, one of the requirements is conducting of the safety audit as per the statutory requirement.

In order to meet not only the statutory regulations under Factories Act, But also to self assess the implementation part of safety management systems and site specific safety improvement; HGL conducted External Safety Audit for this year by a reputed external agency followed by strict scrutiny.

So as to comply with the requirement, SEIL Management is engaging outside agency, for evaluating its occupational health and safety management system performance, followed by compliance of the observations and as part of it, engaged **Global Fire and Safety Solutions** for conducting the safety audit for the year 2024.

Global Fire and Safety Solutions feels it as an honor for getting the above assignment. **Global Fire and Safety Solutions** took this opportunity and carried out the audit, with an objective to review the various work practices and activities of the organization, such that the Occupational Health and Safety functioning of the organization is in line with the regulatory and other OHS system requirements.

2.0 INTRODUCTION

SEIL Energy India Limited (Formerly Sembcorp Energy India Limited) is a leading independent power producer (IPP) committed to India's energy security. The company has a successful track record of developing and operating thermal power generation assets in the country. It has a 2.64 GW supercritical thermal power generation complex located in SPSR Nellore district, Andhra Pradesh, India.

The SEIL employee count in Plant -1 is 323 whereas in Plant-2 is 267. The contractor employee count in Plant-1 is 819 whereas that in Plant-2 is 767. Around 46 contractors are listed to supply the associate employees for various Operations and Maintenance within the plant.

2.1 Products manufactured in the unit:

Power generation in the plant

2.2 Process description- Process Flow Chart:

Process Description:

SEIL Energy India Limited, Project -1 has 2 X 660-Megawatt Supercritical coal-fired units. And SEIL Energy India Limited Project -2 has same 2 X 660-Megawatt Supercritical coal-fired units.

SEIL has its own team for managing the operations and maintenance of the power plants. The two power Plants Project-1 and Project-2 are spread over 2750 acres area. The source of water for both the plants is the sea water as the plant is located near the Bay of Bengal. The coal is brought to the site through the sea route and transferred to the coal storage area through pipe conveyors. The belt conveyors are used to transfer coal from the coal yard to the bunker.

**List of Equipment:**

The Equipment is boilers, ESP (Electrostatic Precipitators), ash handling area, Coal mill area, Turbine area, warehouses, ETP (Effluent Treatment Plant)/WTP (Water Treatment Plant), sea water pump house, chemical storage area, fire water pump house, Transformer yard, Central control Room, Battery room, mechanical workshop, clarifier, cylinder store area, hydrogen cylinder storage area, Fire station and OHC (Occupational Health Centre), etc.

Manpower:

The SEIL employee count in Plant -1 is 332 whereas in Plant-2 is 267. The contractor employee count in Plant-1 is 850 whereas that in Plant-2 is 800. Around 46 contractors are listed to supply the associate employees for various Operations and Maintenance within the plant.

In Thermal Power Station heat energy is converted into electric power. Water is heated in a Boiler, comes out as dry super saturated steam and allows the high pressure steam into the turbine, spins the turbine shaft which drives an electric generator and produces electric power. The steam from the turbine is condensed in a condenser and recycled back to Boiler where it is heated. This is known as Rankine cycle.

The crushed coal is coming through Ship from Paradeep Port to Krishnapatnam port. Further, the coal is transported from the Krishnapatnam port to plant site through external coal pipe conveyor. The imported coal comes from Indonesia, and other countries through ship and it is transported through external coal conveyor. The coal plant having 3 nos. coal stacking yard each is having storage. The coal from the coal yard is transported to Crusher house

The coal is crushed in coal mill and converts into a powder form and is being transported to boiler for combustion through primary air. The primary air supplied by primary air fans and forced draft Fans are used for supplying combustion air to the boiler. 2nos. Induced draft fans are used to extract post combustion combustible products from the boiler and pass through regenerative Air Preheater and filtered out fly ash in the ESP (Electrostatic precipitator) and finally the flue gas is liberated into the atmosphere through a tall chimney. The combustion is taking place in a boiler which is slightly under below atmospheric pressure and produces heat at temperature of 1200°C. The Demineralized Water (DM) is circulated into the boiler through forced boiler circulation pump and absorbs heat from the boiler and converts into high dry pressure of 240 ksc and temperature of 565°C.

The high pressure and temperature steam is allowed to pass into the High pressure turbine through stop valves and control valves. The steam expands in the turbine blades and does useful work and spins the turbine. The exhaust steam from the HPT is reheated in the boiler pre-heater circuit and converts a pressure and required temperature. The medium pressure steam is allowed to pass into pressure turbine (PT) where it does some useful work and pass into turbine and finally this steam is condensed in the condenser.

A huge amount sea water is circulated into the condensers through circulating pumps and it absorbs heat from the exhaust steam of Turbines and finally it passes into natural draft cooling tower for cooling. During the process of condensation in the condenser, the steam to water phase conversion is taking place and non-condensable gasses are liberated through this process. These gases are expelled to the atmosphere through 2nos. vacuum pumps for each condenser.

The condensed water is pumped to the de-aerator through 4 nos. of Low pressure heaters where the condensate water temperature is raised from 38°C to 154°C. High pressure pumps are used to pump the de-aerator water to the boiler through 3 nos. High pressure heater where the feed water is heated up to required temperature. Thus the process circulates (Boiler – Turbine-Boiler) on continuous basis to generate power of 660 MW.

During the production of 4 x 660 MW power, it consumes nearly 400 tons of coal per day at different heating values of coal of 3000-4400 kcal/kg. Around 4000 tons of ash produced daily through the coal burning process, 80% of the ash is collected in the dry form and stored in the Silos and 20% of the ash collected in the wet mode and pumped to ash pond in required size. The dry fly ash is collected from the Silos and filled in closed truck ash tanker for utilization of Brick & Cement and Small Scale Industries.

Sea water is the source for the above process. Sea water is drawn from the sea through pumps at sea water pump house. The sea water is processed and converted into Service & DM water through Reverse Osmosis process.

The power is evacuated through transmission line with no of feeders connected to AP and Telangana Grid. The power generated in the alternator at a voltage of 22 KV (P-1) and 20KV (P-2) and stepped up to 400KV by step-up transformer called Generator Transformer of Single phase transformers of capacity 270MVA(P-1) 260MVA(P-2).

Two numbers Service Transformers (ST) of capacity 400KV/11KV, 100MVA each were installed to draw power from grid to feed to 11KV station boards in addition to generated power.

The total process is controlled in centralized Central Control Room (CCR) with latest art of Super critical technology and it is one of the first of its kind in the Private sector as 4 x 660 MW Super Critical Power plant named as “SEIL Energy India Limited”
